Cyclized somatostatin analogs for inhibiting growth hormone secretion from anterior pituitary and as antiproliferative agents for the treatment of tumors.

Example 11; Page 61; 82pp; English.

This sequence represents a somatostatin analogue of the invention. The invention relates to a backbone cyclised somatostatin analogue that has

                                                                                                                                                                                                           analogues can be used for the treatment patients with hormone-secreting and hormone-dependent tumours. They reduce diarrhoea through the inhibition of vasoactive intestinal peptide (VIP) secretion and by direct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               angiogenesis; lymphangiogenesis; vascular endothelial growth factor; cytostatic; hepatotropic; antiinflammatory; hypotensive; antidiabetic; vulnerary; cell surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.
one building unit containing a nitrogen atom of the peptide backbone connected to a bridging group comprising an amide, thioether, thioester or disulphide. At least one building unit is connected via a bridging group to form a cyclic structure with a moiety selected from a second building unit, side chain of or N-terminal amino acid residue. A composition containing the analogue may be used for preventing disorders such as cancers, autoimmune diseases, endocrine disorders, diabetic diseases, pencreatis, atherosclerosis, restenosis and post-surgical pain. It may also be used for diagnosing cancer. The backbone cyclic analogue is used for imaging the existence of metastases. Somatostatin
                                                                                                                                                                                                                                                                effect on intestinal secretion. Somatostatin analogues selective to type 2 and 5 receptors may be used for treatment of non-insulin dependent diabetes mellitus. They are useful for the prevention of atherosclerosis and restenosis. The analogues are metabolically stable, selective in their in-vivo activities and safe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vascular endothelial growth factor receptor 3 inhibitor; VEGFR-3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, puncress, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemangiomas and diabetes. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the

The method relates to a method of identifying a modulator of cell growth, comprising assessing and comparing the activities of site-specific DNA recombinase (I) or type I DNA topolsomerase (II) in presence and absence of a test substance. A difference in activity of (I) and (II) assessed in the presence and absence of the test substance indicates that the test substance modulates cell growth. The identified cell growth modulator, preferably an inhibitor of (I) or (II), is useful for inhibiting cell growth in a subject, preferably a human. The inhibitor inhibits (I) which having or suspected of having tumour or cancer, where the method further involves administering an effective of antitumour or anticancer agent or
                                                               peptide derivs. - are neurokinin A and tachykinin antagonists for treating asthma or as analgesics.
                                                                                                                                                                                 The patent describes novel cyclic hexapeptide and octapeptide compounds which are antagonists of neurokinin A and which are useful medically as analgesics and for treating respiratory diseases such as athma. The present sequence represents a specifically preferred example of the new
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tyrosine recombinase; antibacterial; cytostatic; cell growth modulator; site-specific DNA recombinase; type I DNA topoisomerase; tumour; tyrosine recombinase; cancer; Holliday junction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                     The present invention describes backbone cyclised somatostatin analogues (I) that incorporates at least one building unit containing one nitrogen atom of the peptide backbone connected to a bridging group (comprising an amide, thiotether, thioester or disulfide) where at least one building unit is connected via the bridging group to form a cyclic structure with a moiety selected from the group consisting of a second building unit, the side chain of an amino acid residue of the sequence or the N-terminal amino acid residue. (I) has antiatteriosclerotic, immunosuppressive,
                                                                                                                                                                                                                                                                                                                                                                                                                                  associated complications, endocrine disorders, inflammation, gastrointestinal disorders, pancreatitis, post-surgical pain, and restenosis. (I) can also be used in the disgnosis of cancer, by imaging the existence of mecastases, it being labeled with a detectable probe. The present sequence represents a backbone cyclised somatostatin analogue
                                                                                                                                                                                                                                                                                                                                                                cytostatic, antidiabetic, antiinflammatory and analgesic activities, and can be used as a somatostatin receptor ligand. (I) are useful in the treatment of atherosclerosis, autoimmune diseases, cancers, diabetic-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "not an N-terminal amino acid, but condensed with {\tt Irp(6)} to form a cyclic peptide"

This sequence represents a somatostatin analogue of the invention. The invention relates to a backbone cyclised somatostatin analogue that has connected to a bridging group comprising an amide, thioether, thioester or disulphide. At least one building unit is connected to a bridging group comprising an amide, thioether, thioester or disulphide. At least one building unit is connected from a second building unit, side chain of or N-terminal amino acid residue. A composition containing the analogue may be used for preventing disorders outh as cancers, autoimmune diseases, endocrine disorders, inflammatory diseases, pancreatitis, atherosclerosis, restenosis and post-surgical associated complications, gastrointestinal disorders, inflammatory diseases, pancreatitis, atherosclerosis, restenosis and post-surgical cancer and hormone-dependent tumours. They reduce diarrhoea backbone cyclic analogues can be used for the treatment patients with hormone-secreting and hormone-dependent tumours. They reduce diarrhoea through the inhibition of vasoactive intestinal peptide (VIP) secretion and by direct effect on intestinal secretion. Somatostatin analogues selective to type cancer metalitus. They are useful for the prevention of atherosclerosis and restenosis. They are useful for the prevention of atherosclerosis and restenosis. They are useful for the prevention of atherosclerosis and restenosis. They are useful for the prevention of atherosclerosis and restenosis. They are useful for the prevention of atherosclerosis
                                                                                                                                                                                                                                                                                 Somatostatin analogue; therapy; cyclic peptide; autoimmune disease; endocrine disorder; cancer; diabetic-associated complication; diagnosis; gastrointestinal disorder; inflammatory disease; panoreatitis; atherosclarosis; restenosis; post-aurgical pain; VIP secretion inhibitor; hormone-secreting tumour; hormone-dependent tumour; diarrhoea; vasoactive intestinal peptide; non-insulin dependent diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cyclized somatostatin analogs for inhibiting growth hormone secretion from anterior pituitary and as antiproliferative agents for the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               'note= "D-form residue"

(I) has antiarteriosclerotic, immunosuppressive, cytostatic, antidiabetic, antinflammatory and analgesic activities, and can be used as a somatostatin receptor ligand. (I) are useful in the sestiment of atherosclerosis, autoimmune diseases, cancers, diabeticassociated complications, endocrine disorders, inflammatoris, gastrointestinal disorders, pancreatitis, post-surgical pain, and restenosis. (I) can also be used in the diagnosis of cancer, by imaging

the existence of metastases, it being labeled with a detectable probe. The present sequence represents a backbone cyclised somatostatin analogue from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of identifying a ligand that can mediate the biological activity of target protein via inhibition of the binding of target protein to a binding partner ligand comprising screening first combinatorial library having first member ligands for binding to target protein to identify target-binding ligand(s). The method is useful for identifying ligands that can mediate the biological activity of target proteins via inhibition of the binding of target protein to a binding partner ligand. The invention does not require the natural binding partner ligand. The seagent. The need for the natural binding partner will the use of complementary combinatorial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identification of ligand that can mediate biological activity of target protein, comprises screening first combinatorial library having first member ligands for binding to target protein to identify target-binding

AAR46290;
vasculitis; pregnancy associated toxaemia; transplantation, surgery. Peptides which bind to endothelin receptors may act as agonists or antagonists depending on whether they effect or block the activity of the receptor. They may be used to modulate conditions such as cardiogenic shock, hypertension, pulmonary hypertension, acute myocardial infarction, uraemia, Crohn's disease and ulcerative colitis which are associated with increased levels of endothelin. Increased endothelin levels are also observed following orthotopic liver transplantation and major abdominal sepsis, congestive heart failure, coronary spasm, cyclosporine nephrotoxicity, vasculitis and pregnancy associated toxaemia. (See also AAR48782-R48933). (Updated on 25-MAR-2003 to correct PN field.)

The sequences given in AAR46290-91 are peptides which were used to design the primers given in AAG57005-06 which were used in the amplification and identification of the PTPases, PTP-D1 and PTP-D2. PTP-D1 and PTP-D2 which have slightly different structures from previously reported PTPs. Members of the PTP-D subfamily are characterised by having one, two or three identified amino acid changes in previously defined consenaus sequences in the catalytic phosphatase domains of known PTPases. PTP-D, its antibodies or the DNA encoding PTP-D molecules may be used for activity of PTP-D protein or glycoprotein associated with a cell or tissue. This may be utilised in methods for identifying susceptibility to cancer, diabetes or other diseases associated with alterations in cellular phospho- tyrosine metabolism.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; protein tyrosine phosphatase; antibody; intracellular domain; LAR; CD45; PTP; diagnosis; insulin resistance related disease; syndrome X; non-insulin dependent diabetes mellitus; arteriosclerosis; therapy; heart disorder; signature motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This peptide corresponds to a conserved region of known protein tyrosine phosphatases (PTP). A sense primar (see AAV04937) based on this peptide was used in the PCR amplification of mouse neural tube cDNA. A 359 bp segment was isolated and used to screen a mouse brain cDNA library to identify several overlapping clones containing a 3.2 kb sequence (see AAV404936) encoding a novel PTP-NP (for neural and pancreatic) receptor (see AAW43023) that can be used for modulating growth, differentiation and survival of cells and for drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Protein tyrosine phosphatase-neural and pancreatic poly:peptide(s) and related nucleic acid - useful for modulating growth, differentiation and

This sequence represents a motif of a protein tyrosine phosphatases. The invention relates to an antibody of the invention that has sites specifically recognising the intracellular domain of two or more protein tyrosine phosphatases (PTPs). The antibody is useful for the detection and assay of PTP including novel phosphatases generated by cloning; and diagnosis, treatment and prevention of insulin resistance related diseases and non-insulin dependent diabetes mellitus, syndrome X and arteriosclerosis and heart disorders
                                                                                                                                                                                                                                                                                                                  Antibody for diagnosis and treatment of insulin resistance disorders and syndrome X recognises the intracellular domains of tyrosine kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Thrombospondin is a multi-functional protein capable of interacting with numerous molecules, eg. fibronectin. Peptides have been designed that are derived from the second type I repeat of human modothelial cell thrombospondin. The peptides can be used to bind to fibronectin or other related collagen-binding proteins to inhibit fibronectin-dependent cell adhesion to collagen matrices. The peptides interact directly with the gelatin-binding domain of fibronectin and inhibits the fibronectin function. (Updated on 25-MAR-2003 to correct PN field.)

Identifying and characterizing cells by comparing the pattern of gene expression in a selected gene family.

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a poximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is

```
an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZI7803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor superfamily genes or cadherin superfamily genes. Sequences AAY14603-813 represent conserved peptide motifs based on which the primers of the invention were designed
                                                                                                                                                                                                                                                                                                                                                                                                                                    ò

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Description

Patent No. 6709843

GENERAL INFORMATION:
APPLICANT: YAMAMOTO, Hiroshi
TAPLICANT: TSUJIKAWA, Kazutake
APPLICANT: TSUJIKAWA, Kazutake
TITLE OF INVENTION: AVTIBODIES SPECIFIC FOR INTRACELLULAR DOMAIN OF PROTEIN
TITLE OF INVENTION: TYROSINE PHOSPHATASE
FILE REFERENCE: 19036/37023
CURRENT APPLICATION NUMBER: US/09/743,492A
CURRENT FILING DATE: 1998-07-10
FRIOR FILING DATE: 1998-07-10
NUMBER OF SEQ ID NOS: 10
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 5
LENGTH: 6
TYPE: PRT
ORGANISM: Artificial sequence

Identification of the residue, L-6-bromotryptophan, in peptides from conus imperialis and Conus radiatus venom.";
J. Biol. Chem. 272:4689-4689(1991).
-I- FUNCTION: Does not elicit gross behavioral symptoms when injected centrally or peripherally in mice.
-I- SUBCELMULAR LOCATION: Secreted.
-I- TISSUE SPECIFICITY: Expressed by the venom duct.
-I- MASS SPECIFICITY: Expressed by the venom duct.
                                                                                                                                                                                                                                   Gaps

New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.

Claim 22; Page 81; 149pp; English.

The present invention describes an isolated peptide (I) that binds to and

```
ö
inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, pancreas, colon, stomach, brast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemangiomas and diabetes. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VBGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and itsrating disorders mediated by the activity of the cell surface receptor VBGFR-3 such as cancer, e.g. brain, lung,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vascular endothelial growth factor receptor 3 inhibitor; VEGFR-3; angiogenesis; lymphangiogenesis; vascular endothelial growth factor; cytostatic; hepatotropic; antiinflammatory; hypotensive, antiidiabetic; vulnerary; cell surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.

The present sequence represents a peptide capable of binding Rhesus D antibodies (I). Also described in the present invention are: (1) a nucleic acid (II) encoding (II); (2) a vector (III) comprising one or more (III) operably linked to an expression control system: (3) a cell (IV) comprising (II) or (III); (4) preparing (I); (5) identifying (M1) comprising subjecting expression control system: (3) a cell (IV) peptides having immunologic properties of Rhesus D protein epitopes comprising an antibody/antibody fragment recognising an epitope of Rhesus D protein to several panning rounds with a phage display library, and identifying immunogenic peptide sequences which are minotopes which differ in their amino acid sequences of Rhesus D protein, and (6) peptides (V) with immunological sequences of Rhesus D protein epitopes obtained by (M1). (I) is used to manufacture an agent for the diagnosis, therapy or prophylaxis of diseases associated with Rhesus D antigen, e.g. haemolytic disease of the comborn (HDN) or idiopathic thrombocytopaenic purpura (ITP), for the manufacture of an affinity reagent for anti-Rhesus D antified

(I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, liver, spleen, kidney, lymph node, small intestine, blood cells, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               angiogenesis; lymphangiogenesis; vascular endothelial growth factor; cytostatic; hepatotropic; antiinflammatory; hypotensive; antidlabetic; vulnerary; cell surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.
or removed from body fluids or immunoglobulin preparations. Using (I) as an immunogen to raise anti-Rhesus D antibodies avoids using immunisation with foreign erythrocytes thereby avoiding the risk of transmission of viral diseases like AIDS and hepatitis B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.

The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antiidiabetic and valuerary activities, and can be used in gene therapy. Compositions and wethods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, liver, spleen, kidney, lymph node, small intestine, blood cells, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of
                                                                                                                                          Vascular endothelial growth factor receptor 3 inhibitor; VEGFR-3; anglogenesis; lymphangiogenesis; vascular endothelial growth factor; cytostatic; hepatotropic; antiinflammatory; hypotensive; antidiabetic; vulnerary; cell surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated peptide that inhibits VEGF-C and VEGF-D, useful for
                                                                                                                                                                                                                                                                                                                                                                'note= "X is any amino acid"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antininflamatory, hypotenaive, antidiabetic and valuerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vascular endothelial growth factor receptor 3 inhibitor; VEGFR-3; angiogenesis; lymphangiogenesis; vascular endothelial growth factor; cytostatic; hepatotropic; antiinflammatory; hypotensive; antiidiabetic; vulnerary; cell surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.
                                                                                                                                                              Gaps
neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemangiomas and diabetes. The present sequence represents a VEGFR-3 binding peptide, which is given in the exemplification of the present invention

A method has been developed for identifying a ligand which mediates the biological activity of a target protein (T) by inhibiting the binding of C (T) to a binding partner. The method comprises: (a) screening a first combinatorial library comprising first member ligands for binding to the target-binding ligands (TBLs), to identifying one or more TBLs; (b) screening a second library comprising second member ligands for the binding of one or more of the TBLs to the target protein, and so obtaining one or more inhibitory ligands; and (C) determining which of the inhibitory ligands can mediate a biological crivity of the target protein. The present sequence represents a potential binding peptide for Haemophilus influenzae tyrosine tRNA synthetase from an example of the present invention. The method can be used for identifying drugs which can mediate the biological activity of a target protein. It can be used to identify the biological activity of a target protein. It can be used to identify the biological activity of a target protein. The method can also be used to identify new throughput screens which are essentially identical for similar and dissimilar targets. Pypassing the need to develop distinct assays for biochemically diverse targets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying ligands which mediate biological activity of a protein - by identifying target-binding ligands and screening a library for ligands which inhibit target-binding ligand mediated activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The method is useful for identifying ligands that can mediate the biological activity of target proteins via inhibition of the binding of target proteins via inhibition of the binding of target the natural binding partner ligand. The invention does not require that the natural binding partner he used as reagent. The need for the natural binding partner sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identification of ligand that can mediate biological activity of target protein, comprises screening first combinatorial library having first member ligands for binding to target protein to identify target-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of identifying a ligand that can

The present invention describes peptides capable of binding Rhesus D antibodies (1). Also described in the present invention are: (1) a nucleic acid (II) encoding (I); (2) a vector (III) comprising one or more (II) operably linked to an expression control system; (3) a cell (IV) comprising (II) or (III); (4) preparing (I); (5) identifying (M1) peptides having immunologic properties of Rhesus D protein epitopes comprising subjecting an antibody/antibody fragment recognising an epitope of Rhesus D protein to several panning rounds with a phage display library, and identifying immunogenic peptide sequences which are minotopes which differ in their amino acid sequence from the amino acid sequences of Rhesus D protein; and (6) peptides (V) with immunological properties of Rhesus D protein epitopes obtained by (M1). (1) is used to manufacture an agent for the diagnosis, therapy or prophylaxis of diseases associated with Rhesus D antigen, e.g. haemolytic disease of the newborn (HDN) or idiopathic thrombocytopenic purpura (ITP), for the manufacture of an affinity reagent for anti-Rhesus D antibodies purified or removed from body fluids or immunoglobulin perparations, using immunications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       an immunogen to raise anti-Rheeus D antibodies avoids using immunisation with foreign erythrocytes thereby avoiding the risk of transmission of viral diseases like AIDS and hepatitis B. The present sequence represents an anti-Rhesus D (RhD) antibody related peptide which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to a method of evaluating sample by providing a soluble serum protein (I), one or more compounds physically associated with (I), and a (I)-binding agent that comprises a peptide that comprises a peptide that comprises a peptide that to form a complex including one or more compounds physically associated with (I), separating the complex from one or more compounds physically associated compounds. The sample comprises blood or serum, or is obtained from a bippy. The sample comprises blood or serum, or is obtained from a compounds. The method is useful for detecting modulators that modulate interaction of serum protein-binding compound and serum protein and lor identifying binding ligands for serum protein. The present cand for identifying binding ligands for serum protein. The present sequence represents a serum albumin-binding peptide identified using the method of the invention.
                                                                                                                                                                          Evaluating sample comprising soluble serum protein by forming complex comprising serum protein and physically associated compounds using peptide ligand that specifically binds with proteins, which is separated and evaluated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Granulocyte-colony stimulating factor receptor binding peptide #74
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          G-CSFR; granulocyte-colony stimulating factor receptor; cytokine; haematopoietic growth factor; neutrophil proliferation; AIDS; neutrophil differentiation; acquired immunodeficiency syndrome; chemotherapy-induced neutropaenia; community acquired pneumonia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mceowen-Merrill

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel isolated polypeptides comprising a sequence that binds an immunoglobulin Fc region. The polypeptides are useful as binding molecules for detecting, isolating or purifying immunoglobulin Fc-region polypeptides present in a solution, e.g. whole blood, plasma or transgenic milk. The Fc-region binding polypeptides are also useful for regulating or preventing an antibody response, or for increasing the half-life and over all stability of a therapeutic or diagnostic compound that is administered to or enters the circulatory system of an individual. This sequence represents an Fc region binding
                                                                                                                                       Immunoglobulin Fc region; binding; whole blood; plasma; transgenic milk; antibody response; half-life; stability; circulatory system.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           09-AUG-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABB34417;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 14
            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                          The invention relates to compounds comprising a peptide chain approximately 6 to 40 amino acids in length that binds to granulocytecolony stimulating factor receptor (G-CSR). The compounds contain colony stimulating factor receptor (G-CSR). The compounds contain and the generic sequences XV 1XV 2XV 3XV 4XV 5XV 6XV C7XV 8 (where XV 1 = C = L, A or V; XV 2 = R, A, L, M, R, E, G, D, Q or S; XV 6 = E or V; XV 7 = A or O; and XVI 3 = R, M, H, E Or L) and XVI 1XVI 2XVI 3XVI 4XVI 5 = R, V XV 7 = A or O; and XVI 3 = R, Y Y Y 1 = A, E Or O; XVI 3 = R, F or V; XV 7 = R, V M, N, O, M, R, D, I, S or E; XVI 3 = R, Or V; XV 6 = E, D, T, O, R or A, XVI 7 = R, W, K, L, S, A or O; XVI 8 = R or C i and XVI 9 = W, G or R). The compounds are used for treating conditions controped pneumonia. The compounds are useful as in vitro as tools for understanding the biological role of granulocyte-colony stimulating contropid proliferation and differentiation), including evaluation of factor (G-CSF a haematopoietic growth factor and cytokine that stimulates contropid proliferation and differentiation), including evaluation of metropidil proliferation and differentiation), including evaluation of metropidil proliferation and differentiation), including evaluation of calls, itsed cells, in biological fluid, in tissue homogenates or in purified natural biological fluid, in tissue homogenates or in purified activated cell sorting (FACS), Western blotting or enzyme-linked calls, instead adjecase that would benefit from the ability confidence as a commercial research reagent for various medical and calls expressing G-CSFR on the cell surface (or inside permeabilised colls expressing G-CSFR and allease that would benefit from the ability colon decided by the receptor and colon activation of the invention of the invention of the invention of colls expressing G-CSFR and alleases of biological activities mediated by the receptor and colon activation of the invention G-CSFR. The present sequence is a G-CSFR binding peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                           Novel compounds, useful for treating depressed neutrophil count, comprise peptide chains of approximately 6 to 40 amino acids in length that bind to granulocyte-colony stimulating factor receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 39; DB 5; Length 16; 50.0%; Pred. The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing

                                                                                                                                                                                                                                                                                                                                                                 g
```

The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description
